

Sandhopper Test Stand

- Both Division B and C will use Sandhopper style test stands
- The red handle on the right releases sand from the hopper into the bucket
- The sand chute directs the sand directly into the bucket
- You can control the flow of sand into the bucket by how far the handle is pulled back

Stabilizing the Bucket

- Rule 5.g. The Event Supervisor must allow team members to safely and effectively stabilize the bucket from movement caused by loading of the sand.
- The Sandhopper test stand minimizes stability issues with the bucket.
- At National, both Division B and C will provide two dowels with spring style door stops for stabilizing the bucket.
- No fingers, other instruments or other methods will be allowed to stabilize the bucket
